

CloneDisk : do a live backup of a volume

No Responses »

You have this volume you want to backup but this is a live volume : some apps are constantly writing to it and you need to backup a snapshot.

Lets use [CloneDisk](#) and [VSCSC](#)

On the command line :

-Lets create a shadow volume copy : vscsc.exe -wait f:

In CloneDisk :

-lets assign a x: logical drive letter to our shadow volume copy (step 1 below) -> this step is optional

-lets backup this x: logical drive, or dosdevice if you did not assign a letter, to a file (step 2 below)

You can now restore from this file but also open it in 7zip, mount it with imdisk, etc.
